

Maintenance & Prolonging life of your sheeting- Galvanized

4 Ways To Prevent Rust On Roof Sheeting

Roof sheeting is highly convenient and easy to install. They have many benefits that make them a good choice for roofing. These include durability, withstanding weather extremities and fire resistance. The biggest challenge you will face in maintaining your roof sheeting is with the development of rust. Rust is formed when oxygen and moisture interact, oxidizing the metal and making it weaker. Rust can seriously damage your roof so it's important to put measures in place to prevent rust from occurring.

1. Painting

Painting your roof sheeting is a good way of providing the metal with some protection. Use a primer with at least 80% zinc, this will help prevent corrosion and rust. The roof needs to be cleaned and prepared before the application for you to get the most out of the primer. This will also help your roof last longer as rust and corrosion often shorten the lifespan of the metal.

2. Coat

Using an elastomeric layer of coating that contains an acrylic sealing property on the roof is a good way of preventing rust. This procedure also requires that the roof be cleaned and properly prepared before its application. These kinds of coatings are available in a variety of colours so you can enjoy changing the colour of your roof to give it a prolonged lifespan and meet the needs of your unique aesthetic.

3. Clean Clean

Regularly cleaning your roof is important in maintaining it and preventing rust and corrosion.

4. Maintain

Inspect the roof regularly to detect rust in its early stages and have it attended to as soon as possible.
